STEAM-CHEF

FOR BETTER STEAMING—

*Model 101-2B
Direct Connected
Two Compartments
Capacity—4 Bushels
For the Smaller
Hospital*

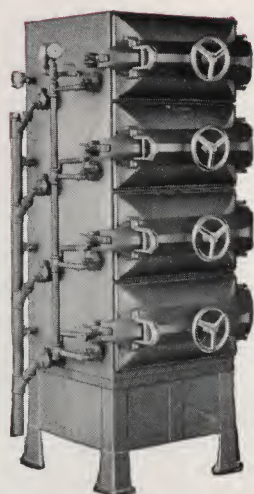

*Model 101-3B
Direct Connected
Three Compartments
Capacity—6 Bushels
The most popular size
Meets all require-
ments of average
hospital*

The DIRECT-CONNECTED STEAM-CHEF

FOR CONNECTION TO CENTRAL STEAM LINE

Direct steam connected STEAM-CHEFS are furnished for hospitals provided with adequate steam supply for kitchen operations. There are direct-connected models with two or more compartments having a range in capacity up to eight bushels per charge for every type and size of hospital food service operation. Such steamers are used in all establishments having central steam, particularly where meals in comparatively large quantity are prepared. Their large capacity, using a minimum of floor space, makes them indispensable.

*Model 101-4B
Direct Connected
Four Compartments
Capacity—8 Bushels
Large capacity for
institutional use*

Durability and long life is assured as a result of the heavy materials and one-piece body construction employed. Effective resistance to interior corrosion is provided by means of hot dip galvanizing or through the use of stainless steel. Moderately priced units are available with attractive and durable baked enamel exterior finishes, and for the utmost in appearance, the polished stainless steel models are furnished—the ultimate in steam cookers.

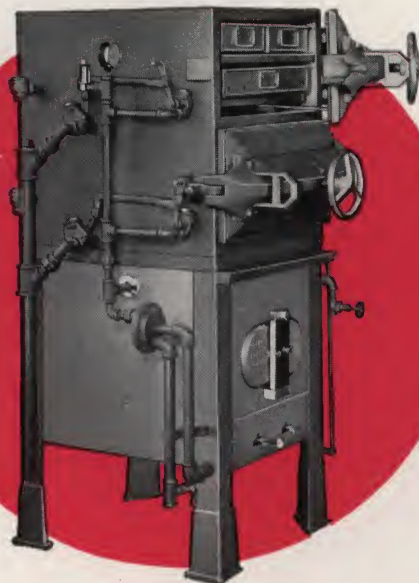

Synchronized thermostatic control, originally developed by STEAM-CHEF

permits the steamer to operate with 3-5 pounds pressure in the compartments, which may be used simultaneously or singly. This control allows no waste of steam or gas. Only the amount of steam required for the steaming process is consumed or generated. As a result, a fuel saving of from 40 to 60 per cent in comparison with ordinary steamers is realized. Synchronized thermostatic control also automatically releases pressure and discharges condensate and steam from the compartments before the doors are opened.

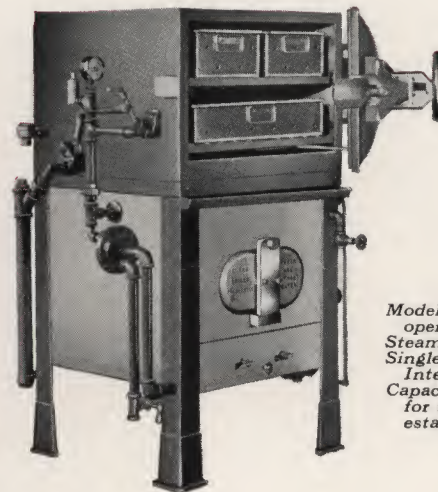

—FOR USE WITH CENTRAL STEAM

operated
Steam generating
Two Compartments
Capacity—4 Bushels
The Universal Steam
generating model*

*Model 1-SC gas
operated
Steam Generating
Single Compartment
Intermediate shelf
Capacity—2½ bushels
for the smaller
establishment*

The STEAM-GENERATING STEAM-CHEF

OPERATED BY GAS OR ELECTRICITY — FOR USE WHERE DIRECT STEAM IS NOT AVAILABLE

Gas or electrically operated STEAM-CHEFS are used in kitchens which are without central steam. These units are of the same rugged design as the direct-connected steamers and provide all the advantages of steam cooking. They generate their own steam using gas or electricity as a source of heat. They are simple to operate, and provide unexcelled service. Two styles, the two compartment and the single compartment are available with capacities of four and two and one-half bushels respectively. These steamers are constructed of the same materials as their direct-steam operated counterparts and have the same controls and all other exclusive STEAM-CHEF features.

There are probably more STEAM-CHEFS in actual service today than all other makes combined, and since STEAM-CHEF was never sold on price, there must be a good reason for that record. All major improvements in steam cooker design and operation of the past twelve years were originated by STEAM-CHEF. They are the result of specialization in the development and production of this one important item of kitchen equipment. In buying a steam cooker don't be satisfied with anything less than a STEAM-CHEF!

Thousands of STEAM-CHEFS are giving highly satisfactory service in hospitals throughout the country, as well as in hotels, restaurants, schools, colleges, clubs, and industrial cafeterias — wherever food in quantity is prepared. Other thousands served the armed forces ashore and afloat, at home and abroad.

STEAM-CHEF makes possible time and labor saving, more nutritious food, lower operating costs, more convenient kitchen operation, less food spoilage, elimination of pan-scouring, large capacity, and greater kitchen flexibility. It cooks a variety of foods FASTER, EASIER, BETTER, and MORE ECONOMICALLY!

GAS OR ELECTRIC OPERATED FOR USE WHERE CENTRAL STEAM IS NOT CONTINUOUSLY AVAILABLE

STEAM-CHEF THE LEADING STEAM COOKER!

MATERIAL AND FINISH. STEAM-CHEF steamer bodies are made of heavy steel, welded seamless and are available (1) hot galvanized after fabrication, with baked enamel exterior. (2) stainless steel interior with baked enamel exterior, or (3) with stainless steel interior and exterior. The latter finish includes chromium plated piping and trim. Both stainless steel models, not available for civilian use during the war, are again the most popular units.

AUTOMATIC SLIDING SHELVES operate with the motion of the compartment doors. The food containers are brought part way out when the doors are opened, and slide back in when the doors close. They provide ease and convenience in handling.

INTERMEDIATE COMPARTMENT SHELVES for the use of shallow pans are furnished for cooking a variety of foods in small quantities. Cafeteria pans are often used and transferred directly to the serving station from the steamer. This eliminates one handling and preserves the conformation of the food, making it more attractive to the consumer.

GAS AND ELECTRIC STEAM-GENERATING UNITS with fully automatic fuel and water control *are an original STEAM-CHEF development.*

STEAMING BASKETS — perforated or solid are provided in a variety of styles and sizes. They are substantially constructed to withstand hard use. Stainless steel baskets afford the utmost in sanitation, long life, and convenience.
